

202A Notes

Chapter 1 Probability Theory

1.1 Set Theory

Def 1.1.1 (Sample space)

The set, S , of all possible outcome of a particular experiment is called the sample space for the experiment.

Def 1.1.2 (Event)

An event is any collection of possible outcomes of an experiment, that is, any subset of S (including S itself).

Th 1.1.4 (Properties of sets)

For any three events, A , B , and C , define on a sample space S ,

1. Commutativity:

$$A \cup B = B \cup A; A \cap B = B \cap A$$

2. Associativity:

$$A \cup (B \cap C) = (A \cup B) \cap C; A \cap (B \cup C) = (A \cap B) \cup C$$

3. Distributive Laws:

$$A \cap (B \cup C) = (A \cap B) \cup (A \cap C); A \cup (B \cap C) = (A \cup B) \cap (A \cup C)$$

4. DeMorgan's Laws:

$$(A \cup B)^c = A^c \cap B^c; (A \cap B)^c = A^c \cup B^c$$

Def 1.1.5 (Disjoint sets)

Two events A and B are disjoint (or mutually exclusive) if $A \cap B = \emptyset$. The events A_1, A_2, \dots are pairwise disjoint (or mutually exclusive) if $A_i \cap A_j = \emptyset$ for all $i \neq j$.

Def 1.1.6 (Partition)

If A_1, A_2, \dots are pairwise disjoint and $\bigcup_{i=1}^{\infty} A_i = S$, then the collection A_1, A_2, \dots forms a partition of S .

1.2 Basics of Probability Theory

Def 1.2.1 (σ -Algebra)

A collection of subsets of S is called a sigma algebra (or Borel field), denoted by \mathcal{B} , if it satisfies the following three properties:

1. $\emptyset \in \mathcal{B}$

2. If $A \in \mathcal{B}$, then $A^c \in \mathcal{B}$ (\mathcal{B} is closed under complementation)

3. If $A_1, A_2, \dots \in \mathcal{B}$, then $\bigcup_{i=1}^{\infty} A_i \in \mathcal{B}$ (\mathcal{B} is closed under countable unions)

Def 1.2.4 (Probability function)

Given a sample space S and an associated sigma algebra \mathcal{B} , a probability function is a function P with domain \mathcal{B} that satisfies:

1. $P(A) \geq 0$ for all $A \in \mathcal{B}$
2. $P(S) = 1$
3. If $A_1, A_2, \dots \in \mathcal{B}$ are pairwise disjoint, then $P(\bigcup_{i=1}^{\infty} A_i) = \sum_{i=1}^{\infty} P(A_i)$

Th 1.2.6 (Simple definition of probability function)

Let $S = \{s_1, \dots, s_n\}$ be a finite set. Let \mathcal{B} be any sigma algebra of subsets of S . Let p_1, \dots, p_n be nonnegative numbers that sum to 1. For any $A \in \mathcal{B}$, define $P(A)$ by

$$P(A) = \sum_{i: s_i \in A} p_i.$$

(The sum over an empty set is defined to be 0.) Then P is a probability function on \mathcal{B} . This remains true if $S = \{s_1, s_2, \dots\}$ is a countable set.

Th 1.2.8 (Properties of the probability function I)

1. $P(\emptyset) = 0$
2. $P(A) \leq 1$
3. $P(A^c) = 1 - P(A)$

Th 1.2.9 (Properties of the probability function II)

If P is a probability function and A and B are any sets in \mathcal{B} , then

1. $P(B \cap A^c) = P(B) - P(A \cap B)$
2. $P(A \cup B) = P(A) + P(B) - P(A \cap B)$
3. If $A \subset B$, then $P(A) < P(B)$

Th 1.2.10 (Bonferroni's inequality)

$$P(A \cap B) \geq P(A) + P(B) - 1$$

$$P\left(\bigcap_{i=1}^n A_i\right) \geq \sum_{i=1}^n P(A_i) - (n-1)$$

Th 1.2.11 (Results for dealing with a collection of sets)

If P is a probability function, then

1. $P(A) = \sum_{i=1}^{\infty} P(A \cap C_i)$ for any partition C_1, C_2, \dots
2. $P(\bigcup_{i=1}^{\infty} A_i) \leq \sum_{i=1}^{\infty} P(A_i)$ for any sets A_1, A_2, \dots (Boole's inequality)

Proof for 2:

We first establish a disjoint collection A_1^*, A_2^*, \dots , with the property that $\bigcup_{i=1}^{\infty} A_i^* = \bigcup_{i=1}^{\infty} A_i$.

$$A_1^* = A_1, \quad A_i^* = A_i \setminus \left(\bigcup_{j=1}^{i-1} A_j \right), i = 2, 3, \dots$$

Therefore, we have

$$P \left(\bigcup_{i=1}^{\infty} A_i \right) = P \left(\bigcup_{i=1}^{\infty} A_i^* \right) = \sum_{i=1}^{\infty} P(A_i^*)$$

where the last equality follows since the A_i^* are disjoint. To see this, we write

$$\begin{aligned} A_i^* \cap A_k^* &= \left\{ A_i \setminus \left(\bigcup_{j=1}^{i-1} A_j \right) \right\} \cap \left\{ A_k \setminus \left(\bigcup_{j=1}^{k-1} A_j \right) \right\} \text{ (definition of } A_i^*) \\ &= \left\{ A_i \cap \left(\bigcup_{j=1}^{i-1} A_j \right)^c \right\} \cap \left\{ A_k \cap \left(\bigcup_{j=1}^{k-1} A_j \right)^c \right\} \text{ (definition of } \setminus \text{)} \\ &= \left\{ A_i \cap \bigcap_{j=1}^{i-1} A_j^c \right\} \cap \left\{ A_k \cap \bigcap_{j=1}^{k-1} A_j^c \right\} \text{ (DeMorgan's Laws)} \end{aligned}$$

Now if $i > k$, the first intersection above will be contained in the set A_k^c , which will have an empty intersection with A_k . If $k > i$, the argument is similar. Further, by construction $A_i^* \subset A_i$, so $P(A_i^*) \leq P(A_i)$ and we have

$$\sum_{i=1}^{\infty} P(A_i^*) \leq \sum_{i=1}^{\infty} P(A_i)$$

Th 1.2.14 (Fundamental theorem of counting)

If a job consists of k separate tasks, the i -th of which can be done in n_i ways, then the entire job can be done in $n_1 \times n_2 \times \dots \times n_k$ ways.

Def 1.2.17 (Combination)

For nonnegative integers n and r , where $n \geq r$, we define the symbol $\binom{n}{r} = \frac{n!}{r!(n-r)!}$

Remark 1.2.18 (Number of possible arrangements of size r from n objects)

1. Ordered, without replacement: $\frac{n!}{(n-r)!}$
2. Ordered, with replacement: n^r
3. Unordered, without replacement: $\binom{n}{r}$
4. Unordered, with replacement: $\binom{n+r-1}{r}$

Remark 1.2.19 (Methods for poker game)

If we wish to calculate probabilities for events that depend on the order, such as the probability of an ace in the first two cards, then we must use the ordered outcomes. If we want to calculate the probability of an event that does not depend on the order, we can use either the ordered or unordered sample space.

Remark 1.2.20 (Sampling with replacement)

Consider sampling $r = 2$ items from $n = 3$ items, with replacement.

Unordered	{1,1}	{2,2}	{3,3}	{1,2}	{1,3}	{2,3}
Ordered	(1,1)	(2,2)	(3,3)	(1,2),(2,1)	(1,3),(3,1)	(2,3),(3,2)
Probability	1/9	1/9	1/9	2/9	2/9	2/9

The formula for the number of outcomes in the unordered sample space is useful for enumerating the outcomes, but ordered outcomes must be counted to correctly calculate probabilities.

1.3 Conditional Probability and Independence**Def 1.3.2 (Conditional probability)**

If A and B are events in S , and $P(B) > 0$, then the conditional probability of A given B , written $P(A|B) = \frac{P(A \cap B)}{P(B)}$

Th 1.3.5 (Bayes' rule)

Let A_1, A_2, \dots be a partition of the sample space, and let B be any set. Then, for each $i = 1, 2, \dots$,

$$P(A_i|B) = \frac{P(B|A_i)P(A_i)}{\sum_{j=1}^{\infty} P(B|A_j)P(A_j)}$$

Def 1.3.7 (Independence)

Two events, A and B , are statistically independent if $P(A \cap B) = P(A)P(B)$

Th 1.3.9 (Independence)

If A and B are independent events, then the following pairs are also independent:

1. A and B^c
2. A^c and B
3. A^c and B^c

Remark 1.3.8 (Independence among more than two events)

The requirement $P(A \cap B \cap C) = P(A)P(B)P(C)$ is NOT a strong enough condition to guarantee pairwise independence.

If A, B, C are pairwise independent, there might be $P(A \cap B \cap C) \neq P(A)P(B)P(C)$.

Def 1.3.12 (Mutually independent)

A collection of events A_1, \dots, A_n are mutually independent if for any subcollection A_{i_1}, \dots, A_{i_k} , we have

$$P\left(\bigcap_{j=1}^k A_{i_j}\right) = \prod_{j=1}^k P(A_{i_j})$$

1.4 Random Variables

Def 1.4.1 (Random variables)

A random variable is a function from a sample space S into real numbers.

Remark 1.4.2 (Random variables)

In defining a random variable, we have also define a new sample space (the range of the random variable). We must check formally that our probability function, which is defined on the original sample space, can be used for the random variable.

Suppose we have a sample space $S = \{s_1, \dots, s_n\}$ with a probability function P , and we define a random variable X with range $\mathcal{X} = \{x_1, \dots, x_m\}$. We can define a probability function P_X on \mathcal{X} in the following way.

$$P_X(X = x_i) = P(\{s_j \in S : X(s_j) = x_i\})$$

Such is also the case if \mathcal{X} is countable. If \mathcal{X} is uncountable, we define in the following way. For any set $A \subset \mathcal{X}$,

$$P_X(X \in A) = P(\{s \in S : X(s) \in A\})$$

1.5 Distribution Functions

Def 1.5.1 (Cumulative distribution function)

The cumulative distribution function or cdf of a random variable X , denoted by $F_X(x)$, is defined by

$$F_X(x) = P_X(X \leq x), \quad \text{for all } x$$

Th 1.5.3 (Properties of cdf)

The function $F(x)$ is a cdf if and only if the following three conditions hold:

1. $\lim_{x \rightarrow -\infty} F(x) = 0$ and $\lim_{x \rightarrow \infty} F(x) = 1$
2. $F(x)$ is a nondecreasing function of x
3. $F(x)$ is a right-continuous; that is, for every number x_0 , $\lim_{x \downarrow x_0} F(x) = F(x_0)$

Def 1.5.7 (Continuous variable)

A random variable X is continuous if $F_X(x)$ is a continuous function of x . A random variable X is discrete if $F_X(x)$ is a step function of x .

Def 1.5.8 (Identically distributed)

The random variables X and Y are identically distributed if, for every set $A \in \mathcal{B}^1$, $P(X \in A) = P(Y \in A)$

Notice that two random variables that are identically distributed are not necessarily equal.

Th 1.5.10 (Identically distributed)

The following two statement are equivalent:

1. The random variables X and Y are identically distributed.
2. $F_X(x) = F_Y(x)$ for every x .

1.6 Density and Mass Functions**Def 1.6.1 (Probability mass function)**

The Probability mass function (pmf) of a discrete random variable X is given by

$$f_X(x) = P(X = x) \quad \text{for all } x.$$

Def 1.6.3 (Probability density function)

The Probability density function or pdf, $f_X(x)$, of a continuous random variable X is the function that satisfies

$$F_X(x) = \int_{-\infty}^x f_X(t) dt$$

Th 1.6.5 (Properties of pdf or pmf)

A function $f_X(x)$ is a pdf (or pmf) of a random variable X if and only if

1. $f_X(x) \geq 0$ for all x .
2. $\sum_x f_X(x) = 1$ (pmf) or $\int_{-\infty}^{\infty} f_X(x) dx = 1$ (pdf).

1.7 Exercises

1.12, 1.18, 1.19, 1.23, 1.25, 1.27, 1.28, 1.45

Some useful formula:

$$\sum_{x=0}^n \binom{n}{x}^2 = \binom{2n}{n},$$

$$\sum_{k=0}^n (-1)^k \binom{n}{k} = 0, \text{ which can be proved using } \binom{n}{k} = \binom{n-1}{k} + \binom{n-1}{k-1},$$

$$\sum_{k=1}^n k \binom{n}{k} = n2^{n-1},$$

$$\sum_{k=1}^n (-1)^{k+1} k \binom{n}{k} = 0$$

$$\text{(Stirling's formula)} \quad n! \approx \sqrt{2\pi n} n^{n+1/2} e^{-n}$$

Chapter 2 Transformation and Expectation

2.1 Distributions of Functions of a Random Variable

Eg 2.1.1 (Binomial transformation)

A discrete random variable X has a binomial distribution if its pmf is of the form

$$f_X(x) = P(X = x) = \binom{n}{x} p^x (1-p)^{n-x}, \quad x = 0, 1, \dots, n$$

where n is a positive integer and $0 \leq p \leq 1$.

Consider the random variable $Y = g(X)$, where $g(x) = n - x$, that is, $Y = n - X$. Here $\mathcal{X} = \{0, 1, \dots, n\}$ and $\mathcal{Y} = \{y : y = g(x), x \in \mathcal{X}\} = \{0, 1, \dots, n\}$. For any $y \in \mathcal{Y}$, $n - x = g(x) = y$ if and only if $x = n - y$. Thus, $g^{-1}(y)$ is the single point $x = n - y$, and

$$\begin{aligned} f_Y(y) &= \sum_{x \in g^{-1}(y)} f_X(x) \\ &= f_X(n - y) \\ &= \binom{n}{n-y} p^{n-y} (1-p)^{n-(n-y)} \\ &= \binom{n}{y} (1-p)^y p^{n-y} \end{aligned}$$

Eg 2.1.2 (Uniform transformation)

Suppose X has a uniform distribution, on the interval $(0, 2\pi)$, that is

$$f_X(x) = \begin{cases} 1/2\pi & 0 < x < 2\pi \\ 0 & \text{otherwise} \end{cases}$$

Consider $Y = \sin^2(X)$. Then

$$P(Y \leq y) = P(X \leq x_1) + P(x_2 \leq X \leq x_3) + P(X \geq x_4)$$

From the symmetry of the function $\sin^2(x)$, and the fact that X has a uniform distribution, we have

$$P(Y \leq y) = 2P(X \leq x_1) + 2P(x_2 \leq X \leq \pi)$$

where x_1 and x_2 are two solutions to $\sin^2(x) = y$, $(0 \leq x \leq \pi)$.

Th 2.1.3 (cdf of transformation)

Let X have cdf $F_X(x)$, let $Y = g(X)$, and let \mathcal{X} and \mathcal{Y} be defined as $\mathcal{X} = \{x : f_X(x) > 0\}$, $\mathcal{Y} = \{y : y = g(x) \text{ for some } x \in \mathcal{X}\}$.

1. If g is an increasing function on \mathcal{X} , $F_Y(y) = F_X(g^{-1}(y))$ for $y \in \mathcal{Y}$.
2. If g is a decreasing function on \mathcal{X} , and X is a continuous random variable, $F_Y(y) = 1 - F_X(g^{-1}(y))$ for $y \in \mathcal{Y}$.

Th 2.1.5 (pdf of transformation)

Let X have pdf $f_X(x)$ and let $Y = g(X)$, where g is a monotone function. Let \mathcal{X} and \mathcal{Y} be defined as Th 2.1.3. Suppose that $f_X(x)$ is continuous on \mathcal{X} and that $g^{-1}(y)$ has a continuous derivative on \mathcal{Y} . Then the pdf of Y is given by

$$f_Y(y) = \begin{cases} f_X(g^{-1}(y)) \left| \frac{d}{dy} g^{-1}(y) \right|, & y \in \mathcal{Y} \\ 0, & \text{otherwise} \end{cases}$$

Th 2.1.8 (General case of transformation)

Let X have pdf $f_X(x)$, let $Y = g(X)$, and define the sample space \mathcal{X} as Th 2.1.3. Suppose there exists a partition, A_0, A_1, \dots, A_k , of \mathcal{X} such that $P(X \in A_0) = 0$ and $f_X(x)$ is continuous on each A_i . Further, suppose there exists functions $g_1(x), \dots, g_k(x)$, defined on A_1, \dots, A_k , respectively, satisfying

1. $g(x) = g_i(x)$, for $x \in A_i$,
2. $g_i(x)$ is monotone on A_i ,
3. the set $\mathcal{Y} = \{y : y = g_i(x) \text{ for some } x \in A_i\}$ is the same for each $i = 1, \dots, k$,
4. $g_i^{-1}(y)$ has a continuous derivative on \mathcal{Y} , for each $i = 1, \dots, k$.

Then

$$f_Y(y) = \begin{cases} \sum_{i=1}^k f_X(g_i^{-1}(y)) \left| \frac{d}{dy} g_i^{-1}(y) \right|, & y \in \mathcal{Y} \\ 0, & \text{otherwise} \end{cases}$$

Th 2.1.10 (Probability integral transformation)

Let X have continuous cdf $F_X(x)$ and define the random variable Y as $Y = F_X(X)$. Then Y is uniformly distributed on $(0, 1)$, that is, $P(Y \leq y) = y, 0 < y < 1$.

Proof: For $Y = F_X(X)$, we have, for $0 < y < 1$,

$$\begin{aligned} P(Y \leq y) &= P(F_X(X) \leq y) \\ &= P(F_X^{-1}[F_X(X)] \leq F_X^{-1}(y)) && (F_X^{-1} \text{ is increasing}) \\ &= P(X \leq F_X^{-1}(y)) \\ &= F_X(F_X^{-1}(y)) && (\text{definition of } F_X) \\ &= y && (\text{continuity of } F_X) \end{aligned}$$

At the endpoints we have $P(Y \leq y) = 1$ for $y \geq 1$ and $P(Y \leq y) = 0$ for $y \leq 0$, showing that Y has a uniform distribution.

The reasoning behind $P(F_X^{-1}[F_X(X)] \leq F_X^{-1}(y)) = P(X \leq F_X^{-1}(y))$ is subtle and deserves additional attention. If F_X is not strictly increasing, it may be that $F_X^{-1}(F_X(x)) \neq x$. Suppose $F_X^{-1}(y) = \inf\{x : F_X(x) \geq y\}$. If F_X is flat when $x \in [x_1, x_2]$, $F_X^{-1}(F_X(x)) = x_1$ for any x in

this interval. Even in this case, the probability equation holds, and the flat cdf denotes a region of 0 probability $P(x_1 < X \leq x) = F_X(x) - F_X(x_1) = 0$.

2.2 Expected Values

Def 2.2.1 (Expected value)

The expected value or mean of a random variable $g(X)$, denoted by $E g(X)$, is

$$E g(X) = \begin{cases} \int_{-\infty}^{\infty} g(x) f_X(x) dx, & \text{if } X \text{ is continuous} \\ \sum_{x \in \mathcal{X}} g(x) f_X(x) = \sum_{x \in \mathcal{X}} g(x) P(X = x), & \text{if } X \text{ is discrete,} \end{cases}$$

provided that the integral or sum exists. If $E|g(X)| = \infty$, we say that $E g(X)$ does not exist.

Th 2.2.5 (Properties of expectation)

Let X be a random variable and let a , b and c be constants. Then for any functions $g_1(x)$ and $g_2(x)$ whose expectations exist,

1. $E(ag_1(x) + bg_2(x) + c) = aE(g_1(x)) + bE(g_2(x)) + c$.
2. If $g_1(x) \geq 0$ for all x , then $E g_1(X) \geq 0$.
3. If $g_1(x) \geq g_2(x)$ for all x , then $E g_1(X) \geq E g_2(X)$.
4. If $a \leq g_1(x) \leq b$ for all x , then $a \leq E g_1(X) \leq b$.

2.3 Moments and Moment Generating Functions

Def 2.3.1 (Moment)

For each interger n , the n -th moment of X , μ'_n , is $\mu'_n = E X^n$. The n -th central moment of X , μ_n , is $\mu_n = E (X - \mu)^n$, where $\mu = \mu_1 = E X$.

Def 2.3.2 (Variance)

The vairance of a random variable X is its second central moment, $Var(X) = E(X - E X)^2$. The positive square root of $Var(X)$ is the standard diviation of X .

Th 2.3.4 (Properties of variance)

If X is a random variable with finite variance, then for any constants a and b , $Var(aX + b) = a^2 Var(X)$.

Def 2.3.6 (Moment generating function)

Let X be a ranodm variable with cdf F_X . The moment generating function of X , denoted by $M_X(t)$, is $M_X(t) = E e^{tX}$, provided that the expectation exists for t in some neighborhood of 0. That is, there is an $h > 0$ such that, for all t in $-h < t < h$, $E e^{tX}$ exists. Otherwise, we say that the moment generating function does not exist.

Th 2.3.7 (Moment generating function and moment)

If X has mgf $M_X(t)$, then

$$E X^n = M_X^{(n)}(0)$$

Th 2.3.11

Let $F_X(x)$ and $F_Y(y)$ be two cdf all of whose moments exist.

1. If X and Y have bounded support, then $F_X(u) = F_Y(u)$ for all u if and only if $E X^r = E Y^r$ for all integer $r = 0, 1, 2, \dots$
2. If the moment generating functions exists and $M_X(t) = M_Y(t)$ for all t in some neighborhood of 0, then $F_X(u) = F_Y(u)$ for all u .

Th 2.3.12 (Convergence of mgf)

Suppose $\{X_i, i = 1, 2, \dots\}$ is a sequence of random variables, each with mgf $M_{X_i}(t)$.

Furthermore, suppose that

$$\lim_{i \rightarrow \infty} M_{X_i}(t) = M_X(t), \text{ for all } t \text{ in a neighborhood of } 0,$$

and $M_X(t)$ is an mgf. Then there is a unique cdf F_X whose moment are determined by $M_X(t)$ and, for all x where $F_X(x)$ is continuous, we have

$$\lim_{i \rightarrow \infty} F_{X_i}(x) = F_X(x)$$

Lemma 2.3.14

Let a_1, a_2, \dots be a sequence of numbers converging to a , that is, $\lim_{n \rightarrow \infty} a_n = a$. Then

$$\lim_{n \rightarrow \infty} \left(1 + \frac{a_n}{n}\right)^n = e^a.$$

Th 2.3.15

For any constants a and b , the mgf of the random variable $aX + b$ is given by

$$M_{aX+b}(t) = e^{bt} M_X(at)$$

2.4 Differentiating Under an Integral Sign

Th 2.4.1 (Leibnitz's rule)

If $f(x, \theta)$, $a(\theta)$ and $b(\theta)$ are differentiable with respect to θ , then

$$\frac{d}{d\theta} \int_{a(\theta)}^{b(\theta)} f(x, \theta) dx = f(b(\theta), \theta) \frac{d}{d\theta} b(\theta) - f(a(\theta), \theta) \frac{d}{d\theta} a(\theta) + \int_{a(\theta)}^{b(\theta)} \frac{\partial}{\partial \theta} f(x, \theta) dx$$

2.5 Exercises

2.3, 2.6(b), 2.8(c), 2.14

Chapter 3 Common Families of Distributions

3.6 Inequalities and Identities

3.6.1 Probability Inequalities

Th 3.6.1 (Chebyshev's inequality) (Proof: Page 122)

Let X be a random variable and let $g(x)$ be a nonnegative function. Then, for any $r > 0$,

$$P(g(X) \geq r) \leq \frac{E g(X)}{r}$$

Example 3.6.2 (Illustrating Chebyshev)

The most widespread use of Chebyshev's inequality involves means and variances. Let $g(x) = (x - \mu)^2 / \sigma^2$. For convenience write $r = t^2$. Then

$$P\left(\frac{(X - \mu)^2}{\sigma^2} \geq t^2\right) \leq \frac{1}{t^2} E \frac{(X - \mu)^2}{\sigma^2} = \frac{1}{t^2}$$

Doing some simple algebra, we get the inequality

$$P(|X - \mu| \geq t\sigma) \leq \frac{1}{t^2}$$

and its companion

$$P(|X - \mu| < t\sigma) \geq 1 - \frac{1}{t^2},$$

Which gives a universal bound on the deviation $X - \mu$ in terms of σ .

3.6.2 Identities

Th 3.6.4 (Gamma distribution) (Proof: Page 124)

Let $X_{\alpha, \beta}$ denote a gamma (α, β) random variable with pdf $f(x|\alpha, \beta)$, where $\alpha > 1$. Then for any constants a and b ,

$$P(a < X_{\alpha, \beta} < b) = \beta(f(a|\alpha, \beta) - f(b|\alpha, \beta)) + P(a < X_{\alpha-1, \beta} < b).$$

Lemma 3.6.5 (Stein's lemma)

Let $X \sim N(\theta, \sigma^2)$, and let g be a differentiable function satisfying $E |g'(X)| < \infty$. Then

$$E [g(X)(X - \theta)] = \sigma^2 E g'(X).$$

Th 3.6.7 (Chi-squared distribution)

Let χ_p^2 denote a chi squared random variable with p degrees of freedom. For any function $h(x)$,

$$E h(\chi_p^2) = p E \left(\frac{h(\chi_{p+2}^2)}{\chi_{p+2}^2} \right)$$

provided the expectations exist.

Th 3.6.8 (Hwang)

Let $g(x)$ be a function with $-\infty < E g(X) < \infty$ and $-\infty < g(-1) < \infty$, then

1. If $X \sim \text{Poisson}(\lambda)$,
 $E(\lambda g(X)) = E(X g(X-1)).$
2. If $X \sim \text{negative binomial}(r, p)$,
 $E((1-p)g(X)) = E\left(\frac{X}{r+X-1}g(X-1)\right).$

Chapter 4 Multiple Random Variables

4.1 Joint and Marginal Distributions

Def 4.1.1 (Random vector)

An n-dimensional random vector is a function from a sample space S into \mathcal{R}^n , n-dimensional Euclidean space.

Def 4.1.3 (Joint pmf)

Let (X, Y) be a discrete bivariate random vector. Then the function $f(x, y)$ from \mathcal{R}^2 into \mathcal{R} defined by $f(x, y) = P(X = x, Y = y)$ is called the joint probability mass function or joint pmf of (X, Y) .

Def 4.1.6 (Marginal pmf)

Let (X, Y) be a discrete bivariate random vector with joint pmf $f_{X,Y}(x, y)$. Then the marginal pmfs of X and Y , $f_X(x) = P(X = x)$ and $f_Y(y) = P(Y = y)$, are given by

$$f_X(x) = \sum_{y \in \mathcal{R}} f_{X,Y}(x, y) \quad \text{and} \quad f_Y(y) = \sum_{x \in \mathcal{R}} f_{X,Y}(x, y)$$

Def 4.1.10 (Joint pdf)

A function $f(x, y)$ from \mathcal{R}^2 into \mathcal{R} is called a joint probability density function or joint pdf of the continuous bivariate random vector (X, Y) if, for every $A \subset \mathcal{R}^2$,

$$P((X, Y) \in A) = \int_A \int f(x, y) dx dy.$$

4.2 Conditional Distributions and Independence

Def 4.2.1 (Conditional pmf)

Let (X, Y) be a discrete bivariate random vector with joint pmf $f(x, y)$ and marginal pmfs $f_X(x)$ and $f_Y(y)$. For any x such that $P(X = x) = f_X(x) > 0$, the conditional pmf of Y given that $X = x$ is the function of y denoted by $f(y|x)$ and defined by

$$f(y|x) = P(Y = y|X = x) = \frac{f(x, y)}{f_X(x)}.$$

Def 4.2.3 (Conditional pdf)

Let (X, Y) be a continuous bivariate random vector with joint pdf $f(x, y)$ and marginal pdfs $f_X(x)$ and $f_Y(y)$. For any x such that $f_X(x) > 0$, the conditional pdf of Y given that $X = x$ is the function of y denoted by $f(y|x)$ and defined by

$$f(y|x) = \frac{f(x, y)}{f_X(x)}.$$

Def 4.2.5 (Independent random variables)

Let (X, Y) be a bivariate random vector with joint pdf or pmf $f(x, y)$ and marginal pdfs or pmfs $f_X(x)$ and $f_Y(y)$. Then X and Y are called independent random variables if, for every $x \in \mathcal{R}$ and $y \in \mathcal{R}$,

$$f(x, y) = f_X(x)f_Y(y)$$

Lemma 4.2.7 (Independent random variables)

Let (X, Y) be a bivariate random vector with joint pdf or pmf $f(x, y)$. Then X and Y are independent random variables if and only if there exist functions $g(x)$ and $h(y)$ such that, for every $x \in \mathcal{R}$ and $y \in \mathcal{R}$,

$$f(x, y) = g(x)h(y)$$

Th 4.2.10 (Properties of independent variables)

Let X and Y be independent random variables.

1. For any $A \subset \mathcal{R}$ and $B \subset \mathcal{R}$, $P(X \in A, Y \in B) = P(X \in A)P(Y \in B)$; that is, the events $\{X \in A\}$ and $\{Y \in B\}$ are independent events.
2. Let $g(x)$ be a function only of x and $h(y)$ only be a function of y . Then $E(g(X)h(Y)) = E(g(X)) \cdot E(h(Y))$

Th 4.2.12 (Independent r.v.s' moment generating functions)

Let X and Y be independent random variables with moment generating functions $M_X(t)$ and $M_Y(t)$. Then the moment generating function of the random variable $Z = X + Y$ is given by $M_Z(t) = M_X(t)M_Y(t)$.

Th 4.2.14 (Independent normal random variables)

Let $X \sim N(\mu, \sigma^2)$ and $Y \sim N(\gamma, \tau^2)$ be independent normal random variables. Then the random variable $Z = X + Y \sim N(\mu + \gamma, \sigma^2 + \tau^2)$.

4.3 Bivariate Transformation**Th 4.3.2 (Independent Poisson)**

If $X \sim \text{Poisson}(\theta)$ and $Y \sim \text{Poisson}(\lambda)$ and X and Y are independent, then $X + Y \sim \text{Poisson}(\theta + \lambda)$.

Th 4.3.5 (Independent)

Let X and Y be independent random variables. Let $g(x)$ be a function only of x and $h(y)$ be a function only of y . Then the random variables $U = g(X)$ and $V = h(Y)$ are independent.

proof:

Assuming U and V are continuous r.v.. For any $u \in \mathcal{R}$ and $v \in \mathcal{R}$, define

$$A_u = \{x : g(x) \leq u\} \quad \text{and} \quad B_v = \{y : h(y) \leq v\}.$$

Then the joint cdf of (U, V) is

$$\begin{aligned} F_{U,V}(u, v) &= P(U \leq u, V \leq v) && \text{(definition of cdf)} \\ &= P(X \in A_u, Y \in B_v) && \text{(definition of } U \text{ and } V) \\ &= P(X \in A_u)P(Y \in B_v) && \text{(Th 4.2.10)} \end{aligned}$$

The joint pdf of (U, V) is

$$\begin{aligned} f_{U,V}(u, v) &= \frac{\partial^2}{\partial u \partial v} F_{U,V}(u, v) \\ &= \left(\frac{d}{du} P(X \in A_u) \right) \left(\frac{d}{dv} P(Y \in B_v) \right), \end{aligned}$$

By Th 4.2.7, U and V are independent.

Remark 4.3.6

It may be that there is only one function, $U = g_1(X, Y)$ of interest. If another convenient function $V = g_2(X, Y)$, can be chosen so that the resulting transformation from (X, Y) to (U, V) is on-to-one on \mathcal{A} . Then the joint pdf of (U, V) can be derived, and the marginal pdf of U can be obtained from the joint pdf.

For example, $U = XY$, we could choose to define $V = X$, then the resulting transformation is one-to-one on \mathcal{A} .

4.5 Covariance and correlation

Def 4.5.1 (Covariance)

The covariance of X and Y is the number defined by

$$\text{Cov}(X, Y) = E((X - \mu_X)(Y - \mu_Y)).$$

Def 4.5.2 (Correlation)

The correlation of X and Y is the number defined by

$$\rho_{XY} = \frac{\text{Cov}(X, Y)}{\sigma_X \sigma_Y}$$

Th 4.5.3 (Covariance and mean)

For any random variables X and Y ,

$$Cov(X, Y) = E XY - \mu_X \mu_Y$$

Th 4.5.5 (Independent)

If X and Y are independent random variables, then $Cov(X, Y) = 0$, and $\rho_{XY} = 0$

Th 4.5.6 (Variation in sums of r.v.)

If X and Y are any two random variables and a and b are any two constants, then

$$Var(aX + bY) = a^2 Var(X) + b^2 Var(Y) + 2ab Cov(X, Y)$$

Th 4.5.7 (Properties of correlation)

For any random variables X and Y ,

1. $-1 \leq \rho_{XY} \leq 1$.
2. $|\rho_{XY}| = 1$ if and only if there exist numbers $a \neq 0$ and b such that $P(Y = aX + b) = 1$. If $\rho_{XY} = 1$, then $a > 0$. If $\rho_{XY} = -1$, then $a < 0$

4.7 Inequalities

4.7.1 Numerical Inequalities

Lemma 4.7.1

Let a and b be any positive numbers, and let p and q be any positive numbers (necessarily greater than 1) satisfying

$$\frac{1}{p} + \frac{1}{q} = 1$$

Then

$$\frac{1}{p} a^p + \frac{1}{q} b^q \geq ab$$

with equality if and only if $a^p = b^q$.

Th 4.7.2 (Holder's inequality)

Let X and Y be any two random variables, and let p and q satisfy (4.7.1). Then

$$|E XY| \leq E |XY| \leq (E |X|^p)^{1/p} (E |Y|^q)^{1/q}$$

Th 4.7.3 (Cauchy-Schwarz inequality)

For any two random variables X and Y ,

$$|E XY| \leq E |XY| \leq (E |X|^2)^{1/2} (E |Y|^2)^{1/2}$$

Eg 4.7.4 (Covariance inequality)

$$E |(X - \mu_X)(Y - \mu_Y)| \leq \{E (X - \mu_X)^2\}^{1/2} \{E (Y - \mu_Y)^2\}^{1/2}.$$

Squaring both sides, we have

$$(Cov(X, Y))^2 \leq \sigma_X^2 \sigma_Y^2$$

Th 4.7.5 (Minkowski's inequality)

Let X and Y be any two random variables. Then for $1 \leq p < \infty$,

$$[E |X + Y|^p]^{1/p} \leq [E |X|^p]^{1/p} + [E |Y|^p]^{1/p}$$

4.7.2 Functional Inequalities

Def 4.7.6 (Convex)

A function $g(x)$ is convex if $g(\lambda x + (1 - \lambda)y) \leq \lambda g(x) + (1 - \lambda)g(y)$, for all x and y , and $0 < \lambda < 1$. The function $g(x)$ is concave if $-g(x)$ is convex.

Th 4.7.7 (Jensen's inequality)

For any random variable X , if $g(x)$ is a convex function, then

$$E g(x) \geq g(E X).$$

Equality holds if and only if, for every line $a + bx$ that is tangent to $g(x)$ at $x = E X$, $P(g(X) = a + bX) = 1$.

Th 4.7.9 (Covariance inequality)

Let X be any random variable and $g(x)$ and $h(x)$ any functions such that $E g(X)$, $E h(X)$, and $E (g(X)h(X))$ exist.

1. If $g(x)$ is a nondecreasing function and $h(x)$ is a nonincreasing function, then

$$E(g(X)h(X)) \leq (Eg(X))(Eh(X)).$$

2. If $g(x)$ and $h(x)$ are either both nondecreasing or both nonincreasing, then

$$E(g(X)h(X)) \geq (Eg(X))(Eh(X)).$$
